

A payment network, *built around people.*

The card scheme for how the world actually pays

September 2026

our thesis

The network is the product.

Cards are only how you touch it

freedom.

Card networks are closed by design

- ✳ Two networks own the rails everyone else builds on
- ✳ Integrating with them is slow, rigid and expensive
- ✳ Acceptance hardware is rented, never owned

The solution

Freedom is a card scheme

Built so the technology underneath is new, but the payment on top feels like something you already know

A card people know

No app to open and no behaviour to learn. It works the way a card is supposed to work.

A merchant network we own

Visa and Mastercard had to build acceptance before anyone could spend. So are we.

Rails that stay open

Cards, banks, wallets and stablecoins on one network, without a gatekeeper in the middle.

How it works

Two sides. One network.

CONSUMER

Tap → Pay

A physical contactless card.

MERCHANT

Phone → Accept

A compatible phone becomes the acceptance device.

*No terminal to buy and none to maintain. The phone is the payment infrastructure.

*Static NFC identifiers are giving way to cryptographic credentials, making a card substantially harder to clone.

freedom.

Coverage

Live in four countries. Two ways in.

PAY-OUTS

 Nigeria

 Kenya

 Uganda

 Tanzania

PAY-INS

NGN

Stablecoins

*A card scheme designed around Africa, not adapted to it.

freedom.

The opportunity

Nigeria already pays digitally

₦1.07 quadrillion

Electronic payments, 2024

11.2 billion

Transactions, 2024

5.56M

POS terminals deployed

₦18 trillion

POS transaction value, 2024

100M+

Nigerians outside the banking system

₦7 trillion

In cash, sitting outside the banks

*NIBSS, 2024. The question is not whether Nigerians can pay digitally — they already do. It is who owns the infrastructure they pay on.

freedom.

Why us

We are not starting from zero

We acquired a bank

Settlement runs on our own rails, not on a partner's.

Cards are spending in four countries

Funded in NGN and stablecoins, accepted today.

The distribution is already there

Enough reach to test a payment network at meaningful scale.

*We are building bottom-up — breaking the stack into its parts and rebuilding each one, starting where the money actually sits.

freedom.

We earn when the network is used

Consumers

Card sales, interchange, cross-border

What we charge on the card itself and on every settlement.

Network usage

Priced per transaction

Authorization, clearing, settlement and access to the network.

Issuers & acquirers

\$0.05 per active card / month · \$0.10 per transaction

What a fintech pays to issue and acquire on Freedom.

Value-added services

Fraud and risk APIs from \$0.01 per check

The long game, and the highest margin line on the network.

Every number, from the ground up

- ★ What a cardholder spends
 $2 \text{ transactions} \times \$37.91 \text{ average} = \$75 / \text{month}$
- ★ Domestic — 90% of that volume
 $\$67.50 \times 0.5\% \text{ merchant charge} = \0.34
- ★ Cross-border — 10% of that volume
 $\$7.50 \times 1.5\%, \text{ uncapped} = \0.11
- ★ Revenue per active card
 $\$0.34 + \$0.11 = \$0.45 / \text{month} \cdot \$5.40 / \text{year}$
- ★ At 10 million active cards
 $10\text{M} \times \$5.40 = \$4.5\text{M} / \text{month} \cdot \$54\text{M} / \text{year}$

*We capture the whole 0.5%, not a slice of it, because we are the scheme, the issuer and the acquirer. Visa and Mastercard net roughly 0.2% of volume as the network alone.

*Card issuance fees, partner-issuer fees and fraud APIs are revenue on top of this and are not counted here.

freedom.

The path

Ten million cards in twelve months

MONTHS 1–3

Prove the loop

100K cards
\$0.5M ARR

Merchant density first. A card is only worth carrying where it already spends.

MONTHS 4–8

Compound the network

1.3M cards
\$7M ARR

Every new merchant makes the card worth more, and every new card makes the merchant worth more.

MONTHS 9–12

Scale the rail

10M cards
\$54M ARR

Nigeria at depth, then Kenya, Uganda and Tanzania on the same rail.

*Ten million inside twelve months means roughly 67% month-on-month growth off a 100K base. That is the bar the distribution is being built to clear.

freedom.

**Visa and Mastercard built the network for cards.
We are building it for programmable money.**

Cards, banks, wallets, stablecoins, merchants — and eventually, agents.

freedom.

Our ask

We are raising to grow the engineering team, fund the infrastructure the network runs on, and hold the settlement liquidity that lets it clear.

freedom.

Assumptions

Where each input comes from

Average transaction size

\$37.91

Observed across our own cardholders

Transactions per card / month

2.0

We observe 2.4; we model 2.0

Monthly spend per card

\$75

$2.0 \times \$37.91 = \75.82 , rounded down

Share of the charge we keep

100%

Scheme, issuer and acquirer are the same company

Merchant service charge, Nigeria

0.5%, capped at ₦1,000

CBN Guide to Charges — a ceiling, not our choice

Does the ₦1,000 cap bind?

No

It binds above ₦200,000 per transaction; we average ₦58,000

Cross-border rate

1.5% all-in

Modelled. Scheme fee plus FX margin, outside the cap

Exchange rate

₦1,530 = \$1

Used throughout

*Every figure above is either observed in our own book or set by regulation. Nothing in the model requires a rate we have not already measured.

freedom.
